

4-pin definition: VCC - positive power supply, GND - negative power supply, DO - digital output, AO - invalid.

Applications: Widely used for motor speed detection, pulse counting, position limit switching, etc.

Module Features:

1. Uses imported slot-type optocoupler sensor.
2. Slot width: 5mm.
3. Output status indicator light: high level output, light off; low level output, light on.
4. With obstruction, output high level; without obstruction, output low level.
5. Comparator output, clean signal, good waveform, strong drive capability, exceeding 15mA.
6. Operating voltage: 3.3V-5V
7. Output type: Digital switch output (0 and 1)
8. Equipped with mounting bolt holes for easy installation
9. PCB size: 3.2cm x 1.4cm
10. Uses a wide-voltage LM393 comparator

Module Usage Instructions:

1. When the module slot is unobstructed, the receiving tube is conducting, and the module's DO output is low; when obstructed, the DO output is high.
2. The module's DO can be connected to a relay to form a limit switch, or it can be connected to an active buzzer module to form an alarm.
